

WHAT IS CLAIMED IS:

1. A socket comprising:

a body having a passage defined through the body, an outer surface of the body being a dark colored surface and a specification being rolled in the outer
5 surface of the body, the specification being coated with a brighter colored electroplating.

2. The socket as claimed in claim 1 further wherein a protection layer is coated on the outer surface of the socket including the specification.

3. The socket as claimed in claim 1, wherein the socket includes a large
10 section and a small section, the specification being rolled in the outer surface of the large section, at least one groove defined in the outer surface of the large section.

4. A method for surface treatment of a socket, the method comprising:

step of rolling an specification in an outer surface of the socket;

step of electroplating the socket with a light colored layer of electroplating;

15 step of removing the light colored layer of electroplating from the outer surface of the socket, and

step of coating a dark colored layer on the outer surface of the socket except for the specification.

5. The method as claimed in claim 4 further comprising a step of coating a
20 protection layer on the outer surface of the socket including the specification after the step of coating a dark colored layer.

6. The method as claimed in claim 4, wherein the dark colored layer is made by immersing the socket into a solution of Manganese Phosphite.
